

A New Evolutionary Law

The world was created on purpose – not by accident. Many people have experienced the unarguably distasteful position as a target for some bird's bombing practice. An old song hints at the truth with the line "gee I'm glad that cows don't fly".

With simple random evolution, birds would grow ever larger, given their aerial attack advantage over their prey. Such proliferation would create no end of havoc on the ground, as large flocks of giant birds filled the skies. Just imagine the ground effect from a flock of elephant sized birds flying over a ball game! Even stainless steel hydraulic umbrellas would be inadequate for such a deluge.

Fortunately, it cannot ever happen because of a recently discovered, yet incredibly simple evolutionary Natural Law.

The Size of the Bird is Limited by the Size of the Turd.

Beyond the absence of Flying Camels, final proof is given by the very existence of the Ostrich and Turkey Buzzard. They have both grown beyond acceptable limits and pay a stiff price for flouting this important law. The Ostrich alas, cannot fly and is reputed to stick its head in the sand as a defense mechanism, leaving a sensitive part of it's anatomy waving in the breeze.

The poor Turkey Buzzard has no functional anal cavity. It is forever destined to regurgitate its bodily wastes thru its mouth– just like politicians and lawyers – who, incredibly, *do* seem to have a choice – there is just no accounting for individual taste.
